Boston, MA | 857-289-4686 | chan.jaso@northeastern.edu | [linkedin.com/in/jasonchan8](https://www.linkedin.com/in/jasonchan8) | jasonchan.codes

Education

Northeastern University, Boston, MA

B.S. in Computer Science, Khoury College of Computer Sciences / GPA: 3.8 / 4.0

Expected May 2027

Experience

DraftKings, Boston, MA

Software Engineering Intern, Casino Native

Aug 2026 – Present | 5 mo full-time

- Built a proof of concept for an unreleased player-facing feature in DraftKings' Android casino app, then turned it into the technical plan the team approved, settling the client architecture and API contract with product and platform engineers.
- Implementing that plan as the sole engineer across 5 scoped tickets, shipping behind a feature flag so the team can enable it for a slice of players and turn it off without cutting a release.
- Merged 10 Kotlin bug fixes across three of DraftKings' consumer apps, Casino, Sportsbook, and Golden Nugget Online Casino, ranging from layout defects to gaps in Datadog logging that were hiding failures in production.

Visa, Foster City, CA

Software Engineering Intern, Payment Product Development

May 2026 – Jul 2026 | 3 mo full-time

- Built an LLM-powered assistant into Visa's cross-border settlement onboarding flow that tells applicants what each of 4 countries requires for a given form field, so they finish without leaving the page to look it up.
- Designed a rules validator for compliance attestations that resolves requirements per account tier and returns three outcomes instead of two, routing ambiguous input to human review instead of guessing a wrong pass or fail; verified with 127 unit tests.
- Rebuilt the form's progress tracking so the progress bar, checklist, and needs-attention count all derive from one state model and cannot disagree; excluded prefilled defaults so the count reflects only what the user still has to do.

Teledyne FLIR, Billerica, MA

Software Engineering Intern, Unmanned Ground Systems

Jan 2025 – Jun 2025 | 6 mo full-time

- Shipped 8 Java features into FLIR's 100K-line Android operator console for unmanned ground vehicles, the software field operators use to run the vehicles in live operations.
- Fixed 40+ concurrency and memory-leak defects across real-time telemetry and video streaming pipelines on Linux, cutting reported system failures by 70%.
- Built REST endpoints for vehicle-to-operator state sync, and wrote the JUnit suites that took the console's test coverage from 35% to 80%.

Projects

Cosign (HackMIT) | C++, Python, TensorFlow, Flask, SocketIO

Sept 2025

- Built an ASL gesture recognition system serving classifications over Flask and SocketIO at sub-200ms inference latency; placed top 15 of 500+ teams at HackMIT.
- Trained a CNN+LSTM pipeline on 90K+ frames across 250+ gestures; added request batching and async processing to hold latency under concurrent load.

X (Twitter) Developer Challenge | Python, LLMs, X API, Chrome Extension

Apr 2024

- Built a scam-post classifier for X that pulls a user's timeline through the X API and flags likely scams with a few-shot LLM, surfacing candidates in a Chrome extension for the user to judge instead of hiding posts on their behalf.
- Wrote the Python pipeline that scored the classifier against 10K+ labeled examples; selected from 1,000+ applicants to build on-site at X HQ over a weekend.

Technical Skills

Languages: Java, Kotlin, Python, C++, C, TypeScript, JavaScript, SQL

Platforms & Infrastructure: Android, Linux/Unix, Docker, AWS, Jenkins, Datadog, Bash

Frameworks & APIs: React, Node.js, Flask, TensorFlow, Spring Boot, RESTful APIs

Data & Testing: PostgreSQL, MongoDB (NoSQL), JUnit
